Energy spectrum of slow secondary ...

the energy spectra of the slow secondary electrons for various thicknesses θ . The spectra are different in character using silicon and beryllium backing; for silicon two peaks appear at a thickness of barium $\theta \approx 1$ to 2 atomic layers, and at $\theta = \lambda = 12$ atomic layers the shape of the spectrum is that of pure barium (λ = zone of emission of slow electrons in barium); for beryllium backing the peaks are absent. This pattern is explained by the relative magnitudes of the secondary electron emission coeff. σ : σ for beryllium is smaller than for barium, while for silicon it is larger than for barium. It is shown that the maximum of the spectrum becomes established at $\theta \approx 2$ atomic layers and its shape at $\theta \approx \lambda$, irrespective of σ and η . This result agrees with the previous investigations. It is suggested that in order to obtain two peaks in the slow electron spectrum the following conditions should be fulfilled: 1) The instrument should be provided with an anti-dynatron electrode to cut off spurious electrons from the collector; 2) The electron work functions of the layers and the backing should be different, i.e. a sufficient difference in the contact potentials is essential; 3) The true coeff. of the secondary electron emission of the layer should

TITLE: A Conference on Co-ordination of Research and Construction Work in the Rubber Industry (Soveshchaniye po koordinatsii planov nauchno-issledovatel'skikh i opytno-konstruktorskikh rabot v rezinovoy promyshlennosti)

PERIODICAL: Kauchuk i Rezina, 1959, Nr 4, pp 48-49 (USSR)

ABSTRACT: The Nauchno-issledovatel'skiy institut rezinovoy promyshlennosti (Research Institute for the Rubber Industry, NIIRP) convened a conference held on March 4th - 7th, 1959 on co-ordination of 1959 programme of research and construction work of the NIIRP, NIIR, the "Rezinoprojekt" Institute, Tsentral'naya laboratoriya (Central Laboratory, TsZL) and the construction and technological departments (KTC) of the plants producing rubber articles. The conference was organised by Gosudarstvennyy Komitet Soveta Ministrov SSSR po khimii (State Committee of the Council of Ministers of the USSR for Chemistry) in conjunction with several councils of national economy etc. More than 200

in the Rubber Industry

representatives attended the meeting. The lectures dealt with experimental work carried out by TsZL and KTO during 1958 and plans for 1959. The Deputy Director of the NIIRP, S.V. Burov, reviewed the work on new plants and technological processes in the rubber goods industry, on conveyor belts and synthetic fibres. He also discussed the processes of ageing and stabilisation of rubbers by the application of heat, light and irradiation, radiation vulcanisation etc. The Deputy Director of NIIR, V.I. Novikov, discussed similar topics, as well as the organisation of work in the rubber footwear industry and in medicine, and new uses of synthetic rubber. The Chief Engineer of the Moscow Factory "Kauchuk", V.K. Smirnov, the Deputy Chief Engineer of the Leningrad Factory RTI, S.K. Turkin, the Chief Engineer of the Sverdlovsk Factory RTI, N.I. Kosynets, and others discussed complex mechanisation and automation in the industry producing rubber articles, mechanisation of transport, automation of supply, and weighing of liquid and granular ingredients, etc.

Card 2/3

A Conference on Co-ordination of Research and Construction Work
in the Rubber Industry

Difficulties encountered by the industry were discussed, e.g. the distribution of new types of raw materials to the various factories. The conference was divided into two sections: a section for construction works and a chemical technology section, which discussed their research and construction plans for 1959.

TITLE: A Meeting Held on the Coordination of Scientific-Research Work and
Experimental-Designing in the Rubber Industry

PERIODICAL: Kauchuk i Rezina, 1960, No. 7, pp. 51 - 52

TEXT: A scientific-technical meeting was held at the Scientific-Research Institute of the Rubber Industry from March 22 - 25, 1960, on the problems of coordinating the plans of the scientific-research work and experimental-designing of the NIIRP, NIIR, the "Rezinoprojekt", the Central Plant Laboratories, designing-technological departments and departments of automation and mechanization of commercial rubber products and rubber products for general consumption for the year 1960. The meeting was organized by the State Committee of the USSR Council of Ministers on Chemistry according to the wishes of a number of National Economy Councils, plants and by the decision of the meeting held the previous year on similar problems. The papers submitted and speeches held summarized the work and plans for 1960. Ye.M. Rabkin, head engineer of the Administration of Tires and Rubber products of the State Committee on Chemistry, held the introductory speech. ✓

on the major tendencies in the development of the rubber industry; S.V. Eurov, deputy director of the scientific division of the NIIRP, read a paper on the results of the scientific research work at the NIIRP and the general paths taken by the institute in this connection. V.I. Novikov, deputy director heading the scientific section of NIIR, discussed the possibilities of increasing the mechanization level of rubber footwear production, latex articles and articles for medical purposes and the study of new synthetic latexes. B.M. Smirina, head engineer at the "Rezinoprojekt" Institute, reported on the new processes of commercial rubber articles production to be introduced at the new rubber plants. Reference was made to the rubber article plant being built as part of the Volga Chemical Combine. A. S. Novikov of the NIIRP presented a paper on the development of new synthetic rubbers both in the Soviet Union and abroad. N.N. Lezhnev of the NIIShP reported on the demands placed on carbon blacks in the rubber industry in the light of modern views of the physico-chemical nature of filling. V.K. Smirnov of the Moscow "Kauchuk" Plant, P.I. Tikhomirov (Leningrad Rubber Article Plant), V.I. Yudin (Sverdlovsk RII Plant), T.N. Titarenko (Kursk Rubber Plant), M.S. Kogan (Yars

slavl' Rubber Article Plant) and others, reported on the development of complex mechanization and automation of the production of molded and unmolded rubber products, the mechanization of transportation in the various technological operations within the shops and between shops and the loading and unloading operations. automating the supply and weighing of liquid and loose ingredients to the mixer, perfecting the technology of production, introducing new types of raw material and new types of articles. The MARS-200, an automatic machine for recording and controlling the temperature on the electrical press, has been installed at the "Krasnyy Bogatyr'" and "Kauchuk" Plants. At the latter a press with removable plates and cassette press-forms is being installed. A new continuous vulcanizer of the open type for vulcanizing molded sponge rubber articles in an air medium and an automatic program control of the vulcanization of rubber bales in boilers were introduced at the Leningrad Rubber Article Plant. At the Kazan' Rubber Article Plant a fissureless method for the production of pressure sleeves was introduced. Certain types of rubber footwear made on a conveyor belt are being manufactured at the "Krasnyy Treugol'nik" and "Krasnyy Bogatyr'" Plants. The mass-production of

Designing in the Rubber Industry

variation belts using ¹⁵caprone fabric has been introduced for application at the CK-3 (SK-3) combine. New rubbers such as CMC-30 (SKS-30), APM-15 (ARM-15), ¹⁵soft nitrile rubbers of the CKH-40 (SKN-40) type and CKH-26 (SKN-26) have been manufactured by a number of plants. Some of the rubber article plants have introduced the production of thermal-resistant material ¹⁵CHC (FKS) ¹⁵and molded articles from fluorine rubber-based material. The "Krasnyy Treugol'nik" Plant has developed the construction of a semi-automatic machine of the turning type for the vulcanization of shoes. The "Krasnyy Bogatyr'" Plant has introduced the production of galoshes with inserted profile parts. It was decided to organize special designing bureaus at the various rubber plants, which would deal with furthering the development of molded products, sleeves, transportation belts, latex technology and to erect special plants for the production of non-standard equipment and conveyor belts for the rubber industry. Further decisions were made on the installation of equipment for footwear molds, introduction of capacities for special-purpose synthetic rubber, for chemical fibres for the industry of commercial rubber products and rubber footwear. ✓

SOURCE: Geomagnetizm i aeronomiya, v. 5, no. 5, 1965, 941-942

TOPIC TAGS: aurora, ionospheric absorption, geomagnetic disturbance, geomagnetic field

ABSTRACT: Two riometers were operated at the Dickson Island Arctic Station during July and August, 1964, to record ionospheric absorption of extraterrestrial radio emission as a function of aurora borealis activity. Both riometers were tuned to 32 Mc and calibrated at a common "quiet day" reference level. One antenna was aimed north and the other was aimed about 50° west of north, so that a strip of the ionosphere approximately 490 km long was under observation. Comparison of dips in simultaneously received signals during auroral activity showed where local absorption minima and maxima were occurring within the observed region. Results of 106 recordings showed that locations of absorption maxima and minima were functions of auroral

TITLE: Sporadic ionization of the aurora polaris type in region E

SOURCE: Geomagnetizm i aeronomiya, v. 5, no. 5, 1965, 937-939

TOPIC TAGS: ionosphere, e layer, ionization, aurora

ABSTRACT: A single manual on the vertical probing of the ionosphere, (J. W. Wright, R. W. Knecht, C. Davis, Rukovodstvo po vertikal'nomu zondirovaniyu ionosfery, IL, 1957) was accepted by almost the entire network of ionospheric stations. Still, the interpretation of ionograms during classification of sporadic reflections in the region E seems to be far from uniform. For instance, stations Lulea and

1/3

UDC: 550. 388.2

L 9782-66

ACC NR: AF5025484

Salechard, having similar geomagnetic latitude, interpreted the percentage of the E_{sa} (sporadic ionization of the aurora polaris type) appearance, during Jan., Feb., Nov., and Dec., 1958, as 40 and 1.4%, respectively. This large difference could not be caused only by differences in the ionospheric parameters above these stations. They were probably caused by subjective personal opinions of the specialists treating the material. An attempt was made to classify various types of E_{sa} and outline their characteristics in order to facilitate and unify their identification. The comparison of ionograms and ascafilms showed that 3 types of E_{sa} occurred most often during reflection from sporadic ionization related with aurora polaris: (1) the classical type of E_{sa} , fully corresponding to the definition given in the J. W. Wright et al. manual; (2) E_{sa} during elevated absorption, appearing at high values of minimal frequency of reflections (it is usually characterized by a decrease in diffusion and scattering and almost complete disappearance of stratification in the upper part of the path); and (3) type E_{sa} , very similar in appearance to E_{s107} and characterized by a gradual increase in the height of the reflection path with increased frequency (it differs from E_s in that reflections are caused by entirely different phenomena in the lower ionosphere). The following characteristics of these reflections should be

2/3

L 9782-66

ACC NR: AF5025484

considered in order to facilitate their identification from ionograms: (1) dependence of the outside appearance on amplification (e.g. during increase in absorption of the ionosphere, the maximum amplification results in the correct identification) and (2) rapid changes in an outside appearance (occasionally a different type appears for a short time, to change rapidly into a true type). Orig. art. has: 3 figures and 1 table.

"Stanki i Instrument" No 2

Until now milling duplicating machines have not been mass produced due to high degree of accuracy necessary in various parts of machine. Describes accurate machine method to produce parts for milling duplicating machines permitting mass production of these machines in near future.

<p>Colloid-chemical theory of salt lakes. S. A. SHCHUKAREV AND T. A. TILMACHIEVA. <i>J. Russ. Phys.-Chem. Soc.</i> 62, 777-816(1930).—Kurnakov, and after him Krutov (<i>C. A.</i> 22, 4424), regard the deposition of salts from seashore lakes as the result of ionic interchange, whereby first SO_4 ions (reaction between MgSO_4 and CaCO_3) and then Mg ions (reaction between MgCl_2 and CaCO_3) are removed from the soln. The above view fails to explain the accumulation of sulfates and carbonates in inland lakes, a phenomenon which can be accounted for on the basis of exchange adsorption by the silt colloids. The greater concn. of Na and Mg ions causes them to displace Ca ions from the clay and humus material of colloidal nature. Geological and climatic changes may transform the sea lake into an inland salt deposit; NaCl is subsequently leached out by the rain water, and the adsorption proceeds in the opposite direction, Ca ions being removed from soln. in exchange for Na as Na_2SO_4 and Na_2CO_3. The above theory, as applied to Lake Sakskoye (Crimea), was experimentally tested by studying the adsorbent properties of the lake silt. It was necessary, in order to remove the adsorbed metallic ions, to wash the silt with HCl, although such treatment resulted in the loss of $\text{Fe}(\text{HS})$, and consequent change in adsorption power. The residue consisted of finely divided clay contg. 2% org. matter. It was suspended in water, and H-electrode titrations were made with BaCl_2, CaCl_2, MgCl_2, NaCl and LiCl solns. For bivalent ions, the adsorption order was $\text{Ba} > \text{Ca} > \text{Mg}$, for univalent, $\text{Na} > \text{Li}$. In solns. more dil. than 0.3 N, the adsorption conformed to Freundlich's isotherm. The adsorption capacity of the silt for H ion appeared to be greater than for Ba ion. The adsorption of Ag ion was followed with the aid of a Ag electrode. Suspensions of the silt were also titrated with NaOH and $\text{Ba}(\text{OH})_2$ solns., the buffer action in the latter case being greater. Addn. of neutral salts also increases the buffer action, which thus depends on the adsorption of cations. The changes in the compn. of the water of salt lakes lying near the sea are caused by biochem. reduction of the sulfates and exchange adsorption. The latter process prevails when the sulfates disappear rapidly from soln. (as in the case of lakes which do not communicate with the open sea).</p> <p style="text-align: right;">B. The oxidation of sodium sulfide and sodium hydrosulfide. S. A. SHCHUKAREV AND E. M. KIRBYVA-TUZULAKHOVA. *J. Gen. Chem. (U. S. S. R.)* 1, No. 8, 1125-1126 (1931). --Oxidation of NaHS by O_2 at atm. pressure produces Na_2SO_4 , Na_2SO_3 and $Na_2S_2O_4$. The reaction appears to occur at the liquid-gas interface and is of zero order. The reaction rate is inversely proportional to the initial concn., and the time required for complete oxidation is inversely proportional to the square of the concn. The rate increases with temp. Na_2SO_3 and $Na_2S_2O_4$ are produced by parallel reactions, and Na_2SO_3 reacts further to give $Na_2S_2O_4$. A mechanism is suggested for this. $Na_2S_2O_4$ is formed more rapidly than Na_2SO_3 , and hence is the main product of the reaction. MeOH retards the oxidation of NaHS. Na_2SO_3 oxidized under the same conditions as NaHS gives only Na_2SO_4 in a first-order reaction. $Na_2S_2O_4$ oxidizes very slowly, forming Na_2SO_3 , Na_2SO_4 , and S. A mixt. of Na_2SO_3 and $Na_2S_2O_4$ oxidizes with an increase in rate for Na_2SO_3 and a decrease for $Na_2S_2O_4$. Evidently $Na_2S_2O_4$ is a poison for the oxidation of Na_2SO_3 , while the latter induces oxidation of $Na_2S_2O_4$. Oxidation of H_2S is much more rapid than that of NaHS, and only H_2SO_4 is formed. Na_2S is oxidized to Na_2SO_4 , Na_2SO_3 , $Na_2S_2O_4$, and probably $Na_2S_2O_5$. The order of the reaction is anomalous. However, the time required for complete reaction is to some extent directly proportional to the concn. The rate increases with temp. Na_2SO_3 and $Na_2S_2O_4$ are formed to a greater extent than from NaHS. Increase of concn. of both NaHS and Na_2S permits some increase in the amts. of Na_2SO_3 and $Na_2S_2O_4$ formed, but Na_2SO_4 is always the chief product. As the amt. of alkali increases the reaction rate decreases and the reaction becomes more complex.

ASAC SLA METALLURGICAL LITERATURE CLASSIFICATION

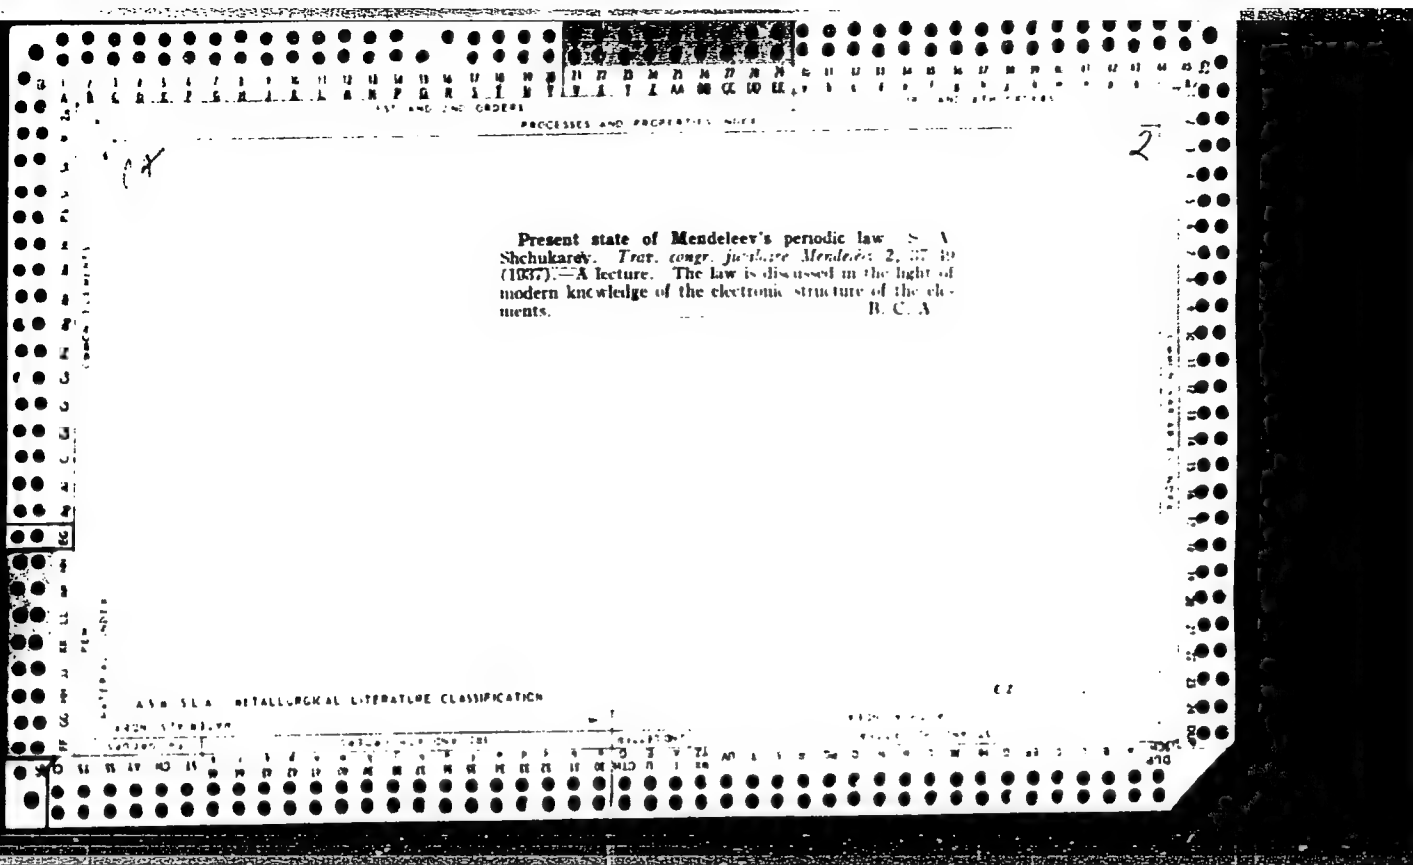

The mobility of chlorine and hydrogen ions in the presence of gelatin. S. A. Shchukarev and V. M. Vdovenko. *Fizykh. Z. Sovetskoih Akad.* 4, 204 (1955; *Russian* (English)).—The decrease in cond. of a 0.1 *N* soln. of HCl on addn. of gelatin at 40° depends on the selective binding of the H ions as shown by the rapid drop in its activity. The transference no. of Cl⁻ (values given correct to 10–12%) rises because of this selective action and because the mobility rises to a max. as the gelatin concn. increases. Louis Goldman.

The element (atomic) weight as a periodic function and the theory of twin elements. S. A. Shchukarev. *Zhur. Obshchei Khim.* (J. Gen. Chem.) 19, 3-15 (1946).—The term "element wt." (E), first used by Mendeleev, is preferred to "at. wt." which is more appropriate for isotopes. Twin elements are pairs of neighboring elements differing in E by approx. 1 unit. There are 19 such cases in the periodic system. In these pairs the preceding element may be either a perisad (an element with an odd at. no.) or an artiad (an element with an even at. no.). The 1st occurrence is the rule up to Ga, the 2nd is the rule beyond Ga. In the plot of $N - P$ (no. of neutrons minus no. of protons in the nucleus) against P , the lines of perisads and artiaids intersect at Ga. If all elements the principal isotopes of which differ in E by approx. 1 unit are included under "twins," there are 30 such pairs. If, further, main isotopes that would differ in E by approx. 1 unit, but for artiad deviations, are included, there are 17 more pairs. Ga has no twin; Cm is paired with the element no. 97. The system of main isotopes has 2 isoneutronic portions, one on the isoneutron (line of equal N) 82 (Ba¹³⁸—La¹³⁸, Ce¹⁴⁰—Pr¹⁴⁰), and one on 126 (Pb²⁰⁸—Bi²⁰⁸—Po²⁰⁸—At²¹⁰). The isoneutrons 38, 82, and 126 divide the system into 4 regions. ⁶⁸Ga⁶⁸, situated on the 38th isoneutron, and ¹¹⁴Sn¹¹⁴, on the 82nd, differ by 70 nucleons (28 protons, 44 neutrons); ¹¹⁴Bi¹¹⁴ and ¹¹⁴Po¹¹⁴ also differ by the same nos. of protons and neutrons. A further manifestation of nuclear periodicity appears in the plot of $E - 2P$ as a function of P , showing complex max. around A, Kr, Xe, and Rn, indicating a periodic tendency to an increase of the no. of excess neutrons. Isoneutronic portions give rise to a saw-like appearance of the curve which disappears if the curve is split into two, one for artiaids and one for

perisads. There is an evident periodicity in the structure of the nuclei, although it is less simple than the periodicity of outer-electron envelopes. N. Thon

CH ✓ The nature of solutions of iodine. I. Spectrophotometric study of reaction of iodine with organic molecules in solutions. S. A. Shchukarev and L. S. Lilich. *Uchenye Zapiski Leningradskogo Univ. im. A. A. Zhdanova* No. 155; Ser. Khim. Nauk No. II, 3-15 (1952).—Spectrophotometric studies showed that I_2 and many org. solvents form 1:1 molar complexes whose stability and degree of dissociation depend on the nature of the org. component. The following solvents were used: pyridine, quinoline, Et_2S , $(PhCH_2)_2S$, Pr_2S , $EtSAm$, Ph_2S , $(PrS)_2$, iso-Am₂Se, dioxane, and BuOH. Erratic results were obtained with O-contg. solvents, apparently owing to relatively low binding energy in complexes with such solvents. The coeff. of distribution of I_2 in CCl_4 vapor is const. as proved by spectrophotometric detns., which give a straight-line plot of concn. in the vapor vs. that in soln. up to $1 \frac{1}{2}$ mole/l. concn. Iodine

"The States of Iodine in Several Organic Solvents," S. A. Shchukarev, L. S. Lillch and A. B. Sheynin

"DAN SSSR" Vol 85, No 6, pp 1333-1335

It is believed that a coordination bond arises between the I and the solvent mol when I is dissolved in an org solvent. In the present work, I is dissolved in varying concns in solvents (CCl_4 , C_4H_9Cl , C_2H_5Br , C_4H_9Br , and C_2H_5I) and the vapor pressures of I noted. It is found

238T18

to decrease in the following order: $CCl_4 > RCl > RBr > RI$. The vapor pressure of I_2 over CCl_4 follows Henry's law of soln. The degree of interaction of I with the solvent increases with the degree of the electron-donating properties of the solvent. The hypothesis of the formation of a coordination-covalent bond between the I and the solvent is confirmed. Presented by Acad A. N. Terenin 18 Jun 52

✓Gravimetric method for measuring the pressure of a saturated vapor. G. I. Noykov and S. A. Shchukarev. *Uchenye Zapiski, Leningrad. Gosudarst. Universiteta. Ser. Khim. Nauk* No. 163, Ser. Khim. Nauk No. 12, 37-40 (1953).— A static gravimetric method is described for the measurement of the pressure of a solid vapor which is useful in the case of high-boiling and chemically active substances. The method was applied to the vapors of WCl_6 over the temp. range 156-353°. The data appear to be a good continuation of those obtained by Vernon (*C.A.*, 31, 8285) at low temps. The heat of vaporization was calculated and found to be equal to 13.7 kcal./g. mole. J. Rovlar Leach

The heats of reaction of hydrates of oxides of zinc, copper, (II), and barium with hydrochloric and nitric acids and hydrogen halide acids. S. A. Shchukarev, L. S. Lilich, and V. A. Latysheva. *Doklady Akad. Nauk S.S.S.R.* 91, 273-6 (1953).—It is known that ions of Zn and Cu(II) in water soln. can form unstable complex ions with halogen ions. Therefore it was reasonable to expect that for Zn and Cu the effects of neutralization by acids differing by nature of anions would not be equal. Heat effects of reaction of $Zn(OH)_2$, $Cu(OH)_2$, and $Ba(OH)_2$ with 2N HCl, HBr, HI, $HClO_4$, and HNO_3 were detd. by direct method with acid always in large excess. HCl and HNO_3 were used for comparison as anions which develop min. tendency toward complex formation. Heat effects for $Ba(OH)_2$ were approx. equal for all acids used, corresponding to Thomsen's results. ZnO in 2N HCl coincided with Peppier's results. Heat effects for $Zn(OH)_2$, ZnO, and $Cu(OH)_2$ in the indicated acids are not equal and increase with transition from Cl^- to I^- , ClO_4^- , and NO_3^- , which affirms the reaction of Zn^{++} and Cu^{++} with anions in soln. The differences between ZnO and $Zn(OH)_2$ in all acids are almost equal and correspond to the literature consts. for hydration of ZnO with formation of $Zn(OH)_2$. Heat effects may attest to detn. of thermal stability and compn. of complex ions formed. V. N. Bednarski

Title : Determination of small ketone amounts by colorimentering in the ultraviolet zone of the spectrum

Periodical : Zhur. anal. khim. 9/4, 193-195, Jul-Aug 1954

Abstract : The applicability of the colorimentering method for quantitative analysis of various aliphatic ketones was investigated. The objects used in this investigation were the following aqueous ketone solutions: acetone, methylethylketone, pentanone-2, hexanone-2, heptanone-2 and octanone-2. The relative accuracy of the analysis attained by this method was 0 - 15%. It was established that the colorimentering of acetone solutions in the presence of formaldehyde is possible also at a acetone-formaldehyde concentration ration of 1 : 100. ✓ Determination of aliphatic alcohols colorimetrically in the ultraviolet range of the spectrum. S. A. Shchukarev, S. N. Andreev, and I. A. Ostrovskaya ~~Vysokomol. Soedin.~~ Usp. Khim. 34: 8 (1965); cf. C.A. 47, 4783j. —The method utilizes ultraviolet absorption of alkyl nitrites. The latter are formed by the action of HNO_3 on alcs. according to: $\text{ROH} + \text{HNO}_3 = \text{RNO}_2 + \text{H}_2\text{O}$. The nature of R has an insignificant effect on the absorption. Alkyl nitrites have a wide absorption band in the range 400–320 $\text{m}\mu$ with 5 peaks at 380, 355, and 345 $\text{m}\mu$. The detn. is carried out with a filter which screens out the 2 end peaks transmitting only in the range around 360 $\text{m}\mu$. For the analysis take 20 ml. of H_2SO_4 -washed petr. ether (35–100° fraction), 20 ml. of the soln. to be analyzed, and 1 ml. 5N HCl in a separatory funnel. To it add 3 ml. of 25% aq. NaNO_2 and shake the mixt. for 5 min. Transfer the petr. ether layer to another separatory funnel contg. 20 ml. of 10% NaHCO_3 or 0.1N NaOH. Shake the mixt. to remove N oxides, transfer the petr. ether layer to a cylindrical cell with quartz windows, and compare with a similar cell filled with pure petr. ether. Read the results on a calibration curve. Individual alcs. can be detd. with a relative error of 1–20%; the sum of alcs. can be detd. with a calibration curve prepd. with BuOH, with a relative error of 11–21%, MeOH excepted. M. Hosen

Title : The periodical law of D. I. Mendeleev as the basic principle of modern chemistry.

Periodical : Zhur. Obshchei Khim. 24, Ed. ⁴ 581 - 592, April 1954

Abstract : The D. I. Mendeleev periodical law, according to the author, should be considered as the basic principle of chemistry, controlling the intermittent, qualitative changes accompanying the conversion of one element into another and confirming the periodicity of these changes depending upon the behavior of the nucleus and external atomic electrons, qualitative changes in the consecutive series of elements oriented in the order of increase of nuclear charges ranging from hydrogen to centurium. Nine references; all USSR; 6 since 1950, 3 of earlier date. Tables, graphs.

Title : Higher barium phosphides

Periodical : Zhur. ob. khim. 24/8, 1277 - 1278, August 1954

Abstract : The derivation of higher barium phosphides (BaP_2 and BaP_3) in a state of thermal equilibrium at low P-vapor pressures, is described. The thermodynamic stability of BaP_2 , a compound analogous to barium nitride, was found to be much higher than in the case of N-compound. The fluctuations in the formation enthalpy, during transition from one element into another, are explained. Three USSR references (1945 and 1953). Table.

2409. Method of analysis of tungsten chlorides.
S. A. Shchukarev, G. I. Novikov and N. V. Andreeva

(Zavodsk. Lab., 1965, 21 [4], 401-403).—It is shown that WCl_6 boiled with water, or heated in an atmosphere containing water vapour, is completely hydrolysed and can be determined from the amount of HCl produced. The material is placed in a crucible supported inside and near the closed end of an inverted test-tube. The open end of the test-tube stands in a beaker containing a standard alkali solution. An electric heater round the closed end is available for heating the crucible to 150° to $200^\circ C$. The top of the crucible carries a capillary tube partly filled with water. When the heater is switched on, the water is forced into the crucible by

the expansion of air in the capillary. After being heated for 1 to 1.5 hr. the crucible is removed and ignited in a muffle-furnace to give the weight of WO_3 . Any residue on the walls of the test-tube is washed into the alkali soln. and the chloride is determined. The method is suitable also for the lower chlorides of tungsten and for many other hydrolysable chlorides. The apparatus can be used to remove and determine ammonium chloride in ammoniacal solutions of WCl_6 . G. S. SMITH

CHV The effect of the concentration of acids on the heat effect of their reaction with the hydrates of zinc and barium oxide. S. A. Shchukarev, L. S. Lishch, and V. A. Latysheva (Zhurnal Obshchei Khim. 25, 1444-8 (1955); cf. C.A. 48, 8019c).—The heat effect of the reaction of HCl, in large excess, with Ba(OH)₂ was independent of the acid concn. The heat effect for the reaction of Zn(OH)₂ with the following acids was studied: HCl, HBr, HI, and HClO₄. The acid concn. in these cases had a significant effect. For HCl, HBr, and HI the curve of enthalpy vs. concn. passed through a min. For HClO₄, an increase in concn. produced a progressive decrease in the enthalpy. The heats of hydration of Ba⁺⁺ and Zn⁺⁺ were calcd. to be 813 and 499 kcal., resp. J. Rovtar Leach

✓ The study of complex compounds in solution by their absorption spectra. S. A. Shchukarev and O. A. Lobanova. *Doklady Akad. Nauk SSSR* 3 (1955). — The bivalent Ni and Co compds. were studied by a spectrophotometric method which allowed conclusions regarding complex formation in soln., and their forms. In the method, the max. absorption bands of the different complexes are singled out from the total absorption. The method consists in measuring the absorption-change curves of definite compds., combined with Bjerrum's formation-function method (C.A. 40, 4590¹). Chemically pure, anhyd. CoBr₂, NiBr₂, LiCl, and acetone were titrated in a visual vertical colorimeter having U air-filters, with a transmission range of 4200–7500 Å. The absorption bands were measured on a quartz differential spectrophotometer. The construction of the calibration curves is described; for the colorimetric titration, and how conclusions can be drawn from the curves is discussed. W. M. Sternberg.

Title : Pressure of Saturated Vapor of Vanadium Tetrachloride

Orig Pub: Zh. neorgan. khimii, 1956, 1, No 1, 30-35

Abstract: The purpose of the work is to check the previously obtained data (Simons J. H., Powell M. G., J. Amer. Chem. Soc., 1945, 67, 75) and to enlarge the temperature range somewhat. VCl_4 was prepared by chlorinating aluminothermic V. A scheme of the chlorination installation is attached, the method of work is described. The pressure of the saturated vapor PVC1_4 was determined by the flow method permitting to compute the partial pressures of VCl_4 and Cl_2 separately. Dried and purified N_2 was used as a gas inert in reference to VCl_4 . PVC1_4 was determined in

Card 1/2

Abs Jour: Ref Zhur-Khimiya, No 5, 1957, 14645

Abstract: the range from 0° to 90° . The following was found based on the experimental data: $\log \text{PVC1}_4(\text{mm}) = -(2174 / T) + 5.19$; $L = 9.9 \pm 0.1$ kcal per mole; $\Delta S(\text{vap.}) = 23.8$ entr. units. The checking of the data by the method of measuring the vapor pressure by boiling points within the range from 25 to 85° resulted in following values: $\log \text{PVC1}_4 = -(2185 / T) + 5.21$; $L = 10.0 \pm 0.1$ kcal per mole, $\Delta S(\text{vap.}) = 23.8 \pm 0.4$ entr. units. It follows from the concordance of the results of both these methods that VCl_4 in vapor form is a monomer.

Shchukarev, S. A.

Thermal dissociation of gold chlorides. S. A. Shchukarev, M. A. Granakaya, and V. M. Tsitsina. *Zhur. Khim.* 1, 881-8 (1958). — The partial pressure (atm.) of Cl_2 for the reaction $\text{AuCl}_3 \rightleftharpoons \text{AuCl} + \text{Cl}_2$ (I) is given by equation $\log p = 8.73 - (4547/T)$ ($420^\circ\text{K} \leq T \leq 620^\circ\text{K}$). For the reaction $2\text{AuCl} \rightleftharpoons 2\text{Au} + \text{Cl}_2$ (II), between the same temp. limits, $\log p = 6.23 - (3483/T)$. The extrapolated indicated temps. corresponding to $p = 1$, are, resp., 253° and 273° . For I, ΔH is $+18.5 \pm 1$ kcal./mol., ΔS is 38.5 ± 1.5 entropy units/mol., ΔF is 2.03 ± 0.03 kcal./mol. at 400°K , and 1.08 ± 0.02 at 494°K . For II the corresponding values are ΔH , $+10 \pm 2$; ΔS , 30 ± 3 ; ΔF , 2.52 ± 0.02 (470°K) and 1.84 ± 0.02 (494°K). The heats and entropies of formation are computed to be: $\Delta H(\text{AuCl}) = -8.0 \pm 1$; $\Delta S(\text{AuCl}) = -15 \pm 1.5$; $\Delta H(\text{AuCl}_3) = -27 \pm 1$; $\Delta S(\text{AuCl}_3) = -52 \pm 2$. At temps. below 450°K , AuCl disproportionates to AuCl_3 and Au . Above that temp. AuCl is the stable chloride. No evidence was found for the existence of AuCl_2 . C. H. Fuchsman
